The global chemical industry consists of complex operations, organizations, and processes involved in the manufacturing of chemicals and their applications. In simple terms, the chemical industry can be defined as a sector that applies chemistry and produces chemicals. However, the definition doesn't meet satisfactory standards as it contains no proper description about

chemicals. Chemicals are formulation of substances that have tenacious chemical properties and compositions. These can't be segregated into elements by the application of the physical splitting procedures. The breaking down of chemicals require parting the bonds prevailing between the chemicals. Chemicals are mostly available in solid form, liquid form, gaseous form, and plasma form. With changing range of temperature or pressure, the chemical properties of the substance are likely to change. The chemicals are often blended or combined with other elements in order to initiate different chemical reactions.
