The automotive sector is majorly focused on the growing demand for electric automobiles, as the increasing issues of scarcity regarding conventional fossil fuels have made the development of electric automobiles imperative. Increasing the demand for electric vehicles by making them comparable with conventional vehicles in terms of performance and, especially, refueling times and capacity is likely to be the aim for automotive giants venturing into the electric cars market over the coming years. These issues have plagued the electric cars market since its inception and have been the major thorn in its side ever through its development through the years. As electric vehicles run on "charged" battery packs rather than on a disposable material that can be dispensed into a physical tank, their refueling times are not comparable to traditional vehicle refueling techniques. This has been the major restraint for the electric vehicles market, as this has majorly restricted electric vehicles to be distributed as city cars rather than long-distance travelers, due to the need to replace battery packs or else wait for a few hours before they charge up again sufficiently.
