

Stealth XST Added as a Supported Currency on CryptoWolf Cross-Chain Exchange

Non-custodial exchange platform provides fast, secure anonymous transactions without the need for registration or verification

DOVER, DE, USA, September 12, 2019 /EINPresswire.com/ -- August 27, 2019 - Dover, DE (Press Release): [CryptoWolf](#)'s sophisticated cross-chain engine provides users with the opportunity to exchange Bitcoin, other cryptocurrencies, and fiat currency options for [Stealth](#)'s XST at the best available rates, without any hidden fees.

XST is now also one of three cryptocurrencies that can be exchanged for Euros or Swiss Francs (CHF), joining only Bitcoin and Ethereum as supported coins. Users who wish to exchange their XST for fiat currencies, are able to visit <https://cryptowolf.eu/crypto-to-fiat>, enter the amount that they wish to convert, and the software automatically calculates the amount that will be received at the current market valuation. The entire process is fast, easy and secure.

"We're proud to have been added to the group of premium cryptocurrencies supported by CryptoWolf," stated Dr. James Stroud, lead developer for Stealth. "This is a great service that provides individuals with the opportunity to buy or exchange XST at their convenience, and at a beneficial price. This new opportunity for individuals to exchange XST for Euros or Swiss Francs sets us apart from the majority of coins and speaks to the trust generated by Stealth over the past five years."

Stealth is currently trading on multiple exchanges including Bittrex, Vinex, Bitinka, and SouthXchange. Additional market integrations are in process in anticipation of the full release of the new Quantum Proof-of-Stake development in several months.

Quantum Proof-of-Stake ([qPoS](#)) is the new groundbreaking technology behind the Stealth cryptocurrency. QPoS represents a key breakthrough to achieve the holy grail of crypto: fast, feeless and private transactions on a platform scalable to thousands of transactions per second.

Stealth's unique, public blockchain was launched in 2014, and their lead developer, Dr. James Stroud, recently presented at both Consensus New York and Elev8 Los Angeles, discussing their latest development milestones, including their new proof-of-stake consensus protocols.

ENDS

About Stealth R&D

Stealth provides the fastest cryptographically private digital currency possible. The Stealth blockchain provides almost instant transactions with absolute privacy protection using state of the art cryptography combined with streamlined blockchain execution. This new technology is called Quantum Proof-of-Stake (qPoS).

QPoS represents a key breakthrough to achieve the so-called holy grail of crypto: a fast, feeless, private, and scalable blockchain.
