The navies of multiple countries are currently creating unmanned vehicles to be used in oceanic warfare to discover and terminate underwater mines. This is much more efficient.

Due to the advancement of technology weapon systems have become more sophisticated and having these unmanned underwater vehicles allows military personnel to control the vehicle without actually being inside it. Advantage of adopting the unmanned vehicle is that it can be allowed that the vehicle can remain submerged for longer periods of time because it leaves no room for resupply of food water and oxygen. Also, there is another major application of unmanned underwater vehicles is that they are serving the naval warfare community. The vividness of this technology helps these vehicles and allows them to perform many missions, while also being more cost-effective and preserving military personnel.

Unmanned maritime vehicles are tremendously used in oceanic research, for purposes such as current and temperature measurement, ocean floor mapping, and Hydrothermal vent detection. Unmanned maritime vehicles utilize seafloor mapping, bathymetry, digital cameras, magnetic sensors, and ultrasonic imaging.
