Vehicles that are designed to provide high torque at a comparatively low speed to carry implements or machinery used in the construction and/or agricultural field are called a tractor or agricultural tractors. They can be used for a variety of tasks which include acting as a source of power for mechanized implements. The power take-off shaft provides power from the engine to act as a prime mover for farm machinery and active tools. It can be used in tandem with a plethora of implements to complete operations.

With the implementation of new innovations, agricultural tractors have become highly sophisticated machines capable of accomplishing a diverse range of tasks. Depending on the working conditions, the optimal transmission speed can be selected with the help of a CVT (continuously variable transmission). The increasing use of computers and electronics in tractors helps control the complex systems present in the machine. All the different components of a tractor have certain key elements like actuators and sensors that can be used to automatically execute various functions.
