Introduction

Global Air Dryer Market

Air Dryer is one of the unique types of filter systems that have been specifically designed for the removal of the water that has been inherited in the form of compressed air. The process of the compressing of air helps in the raising of the temperature and the concentrates of the atmospheric contaminants that primarily include the water vapor. At the same time, the compressed air remains at an elevated temperature and 100% relative humidity.

As the compressed air from the Air Dryer cools down, the condensation of the water vapor takes place in the hoses, tanks, pipes, and tools that are downstream from the compressor. The Water vapor is removed from the compressed air for preventing the condensation from occurring and for preventing moisture from interfering into the sensitive industrial processes. The condensed water in the air stream and the presence of excessive liquid are capable of the extreme damaging of the equipment, tools, and methods that rely entirely on the compressed air.

The corrosion in the tanks and pipelines can be caused due to the water. The Air Dryer emulsifies with the grease that is used in the cylinders, washes out the lubricating oils from the pneumatic tools. It also helps in the fog painting of the surfaces and the clump blasting of the media. The primary function of the Air Dryer is to remove the unwanted water with the help of the compressed air generated.
