Systemic mastocytosis is a kind of disorder that results in an extreme number of mast cells in the body. The mast cells normally help in protecting the body from any sort of disease and aid in the healing of the wound by releasing substances like histamines and leukotrienes. The symptoms of systemic mastocytosis comprise of facial flushing, belly cramps, or itching. Some other symptoms may also include feelings of lightheadedness or like losing consciousness. Some of the common triggers include alcohol, spicy foods, temperature changes, and certain

medications. The diagnosis of systemic mastocytosis can be definite by some of the findings like high numbers of mast cells or high levels of the matters that they release in the body, like the tryptase, leukotriene, histamine, or prostaglandin. This diagnosis is done through the help of blood, urine tests, and imaging tests like X-rays, CT scans, and ultrasounds. These tests look into high levels of mast cells or for the substances that they release. The treatment for this systemic mastocytosis may include some medications such as antihistamines, aspirin, and some other drugs that would work against those substances which were released by the mast cells in the body.
