

# Microsoft Mining Cryptocurrency with Human Energy

*Creating wealth through human energy and wearable tech - Humanoid Miners? Microsoft thinks it is the future, and so does CMDX*

ROSEAU, DM, DOMINICA, July 22, 2020 /EINPresswire.com/ -- In early 2020, Microsoft was awarded a patent on a cryptocurrency system that uses body activity data. In this system, bodily activities such as movement, breathing, and other functions and activities are translated into a proof-of-work model

that results in awarding of cryptocurrency in exchange for users' personal data. While the awarding of Microsoft's patent comes as innovative crypto industry news to many, one global wellness brand has been utilizing this model for some time, awarding platform users cryptocurrency for engaging in healthy activities.

“

While the news of Microsoft's patent on a crypto system utilizing human activity as a basis for mining is exciting, this concept is one that CMDX has been leading the way on for the past few years,"  
*Tom McMurrain, CEO of CMDX*

[CMDX](#), a global community dedicated to generating wealth by rewarding healthy living, leverages a method similar to Microsoft's by allowing users to generate wealth via crypto through engaging in healthy activities. Users can link their CMDX accounts to a number of fitness trackers. The tracked physical activity is then translated to CMDXRewards, the brand's exclusive cryptocurrency. The crypto rewards can then be utilized to purchase a wide variety of goods and services across the CMDX platform or traded on exchanges supporting the CMDX token.

Tom McMurrain, founder of CMDX, conceived of the brand's [Burn it and Earn it](#) model that leverages the power of human activity to help people build wealth back in 2017, positioning CMDX at the forefront of the crypto-for-human-activity movement. McMurrain sees exciting possibilities in the ways that CMDX's and Microsoft's model can help people across the world build wealth.

McMurrain argues the exchange of personal data for crypto compensation is a revolutionary next step in helping to lift people out of poverty through something known as Universal Basic Data Income, or [UBDI](#). Many people across the globe have become increasingly familiar with something called Universal Basic Income (UBI), which has gained traction in some countries across the globe as a result of the COVID pandemic. In the US, UBI became a 2020 presidential campaign topic, with democratic hopeful Andrew Yang introducing it more widely to the country.

In the UBI model, people are given a set amount of basic income each month without an expectation of anything in return. Many critics argue that the UBI model supports wide scale welfare. In contrast, proponents of UBDI claim that the model is more sustainable and appropriate, for it requires recipients to give something in exchange for the income they receive.

In the case of CMDX, users give the brand access to health data and are rewarded with an income in the form of cryptocurrency. As McMurrain puts it, UBI is welfare while UBDI is wealthcare.

“While the news of Microsoft’s patent on a crypto system utilizing human activity as a basis for mining and wealth generation is exciting, this concept is one that CMDX has been leading the way on for the past few years,” said McMurrain. “CMDX’s global community is familiar with the model thanks to CMDX’s Burn It and Earn It model and partnership with Human API allows them to build personal wealth by sharing their health data. With the news of Microsoft entering this space, we hope this system of wealth generation gains more traction and becomes more accessible to people across the globe. We invite those interested in improving their health while building their wealth to explore the many benefits that CMDX’s model holds in helping them achieve these goals.”

**CRYPTOCURRENCY SYSTEM USING BODY ACTIVITY DATA** ←

BACKGROUND

[0001] A virtual currency (also known as a digital currency), is a medium of exchange implemented through the Internet generally, or such as the U.S. dollar or the Euro, and typically designed to allow instantaneous transactions and borderless transfer of ownership. Cryptography is used to secure transactions and to control the creation of new units.

[0002] Several cryptocurrencies exist. Among them, the most well known is a blockchain-based cryptocurrency. Most blockchain is central point of control. However, blockchain-based cryptocurrency can also be implemented in a centralized system having a central example of blockchain-based cryptocurrency. It is described in a 2008 article by Satoshi Nakamoto, named "Bitcoin: A peer-to-peer Electronic Cash System".

[0003] A blockchain is a data structure that stores a list of transactions and can be thought of as a distributed electronic ledger the destination identifier. The transactions are bundled into blocks and every block (except for the first block) refers back to a previous block, and maintain the blockchain and cryptographically validate each new block and the transactions contained in the context, solving a difficult problem that is also easy to verify and is sometimes called a "proof-of-work". This process is referred to as "mining" that a lot of trial and error is required to solve a computationally difficult problem. Accordingly, the mining may require enormous
