

Vigna Law Group: Enterococcus bacteremia...where was the ECHO?

VLG: A national neurological injury and malpractice injury law firm, is investigating case of septic emboli strokes and heart valve damage.

CALIFORNIA, UNITED STATES, November 28, 2020 /EINPresswire.com/ -- Greg Vigna, MD, JD, a physician Board Certified in Physical Medicine and Rehabilitation, practicing physician, and national medical malpractice and pharmaceutical injury attorney comments:

"Clearly the medical literature requires every patient with Enterococcus bacteremia (blood infection) to have a transthoracic echocardiography (TEE) to rule out infective endocarditis (heart valve infection) because up to 20% of patients with Enterococcus in the blood had infective endocarditis. The treatment of Enterococcus bacteremia without infective endocarditis is much different than bacteremia with endocarditis and the failure to treat may cause septic embolic strokes and valvular heart damage that causes heart failure requiring open heart surgery and valve replacement.

Dr. Greg Vigna

It is important that anyone who has suffered from valve damage or septic embolic strokes from Enterococcus to have a case evaluation since we identified injuries that were clearly preventable from inadequate treatment both for patients who were hospitalized and those who were managed as an outpatient. Clearly, the failures were caused by hospitals and medical providers who are acting to save money and not provide the necessary medical care based on the medical literature.

We represent those with serious cardiac and neurological injuries caused by failure to treat Enterococcus bacteremia."
