Introduction of advanced pain free drug delivery technologies is promoting the use of musculoskeletal drugs in the musculoskeletal diseases market. Drug delivery systems refer to methods or processes used to [administer a pharmaceutical compound](#) to achieve a therapeutic effect in humans or animals. Drug delivery products such as intrathecal pumps are being used to deliver muscle relaxants such as baclofen directly into the spinal cord to provide instant relief. Intra-Articular drug delivery systems are also widely being used to administer medicines to treat arthritis. In addition, these products reduce spasticity symptoms and lower the side effects caused by oral spasticity medications.

The musculoskeletal disorders market consists of sales of musculoskeletal disorders drugs and related services by entities that produce musculoskeletal disorders drugs to treat musculoskeletal disorders such as arthritis, osteoporosis, osteomalacia, and other disorders. The industry includes establishments that produce drugs to treat rheumatoid arthritis, muscle relaxants to reduce muscle pain, and other drugs used in treating osteoarthritis, analgesics drugs, immunosuppressives.

The [global musculoskeletal disorders drugs market](#) is expected to decline from \$85.7 billion in 2019 to \$75.5 billion in 2020 at a compound annual growth rate (CAGR) of -12%. The decline is mainly due to the COVID-19 outbreak and the measures to contain it. The pandemic is affecting industries across the globe, including the pharmaceutical sector. The restrictions on non-

essential medical services coupled with slowed production of drugs due to extended factory closures in various countries, shortage of APIs and other chemicals, and rise in prices of key ingredients are the key factors for this decline. The musculoskeletal drugs market is then expected to recover and grow at a CAGR of 4% from 2021 and reach \$94.8 billion in 2023.
