

Elite mCommerce v.3.4 now released: Introducing new eCommerce features that help grow online sales

The Elite mCommerce mobile app builder has released version 3.4 with new features for improved user experience, flexible shipping, customization features

EAST BRUNSWICK, NEW JERSEY, UNITED STATES, March 25, 2021 /EINPresswire.com/ -- The Elite

Delivery to your customers through all possible ways and personalized ordering experience is important for any eCommerce business"

Krish - CEO, eGrove Systems Corporation

mCommerce [mobile app builder](#) has released its new version 3.4 with added features for improved user experience, more cost-effective and flexible shipping, increased customization features, and better support for [multi-seller marketplace apps](#). eGrove Systems is proud to help eCommerce businesses to expand their audience with top-of-the-line mobile apps.

Pattern-based Postal Code validation:

Apps can now handle a wider range of shipping/delivery

addresses from countries such as Canada and the United Kingdom with alpha-numeric codes. Store admins can use area codes for location restrictions so only customers whose addresses are in the right area codes are able to place orders.

Distance-based Shipping:

The new version introduces a new distance-based shipping cost, letting sellers set the shipping cost based on km/miles from the store to the delivery location. Store admin can set a fixed shipping cost for a distance of several km/miles from the store and charge per km/mile after that, based on the distance to the delivery location.

The store admin must set a warehouse (store) origin in order to calculate the distance to the customer location destination. Seller-based distance shipping will calculate distance from the seller point or seller warehouse to the delivery location.

This feature offers greater flexibility in the distance-based rate, where the admin can set fixed charges or charges per unit km/mile.

Set prime units and sub-units (Weight-based Scrolling):

Customers can order using prime units such as (1 liter) and add subunits (400ml) and do the

same for weight units such as kilograms and grams. For loose products like fruits, vegetables, or fresh milk, customers can order in quantities in the same way.

Location-based seller navigation:

Customers can select the Delivery Location before shopping to see the sellers available in the selected location. This will help the customers browse local sellers and products with better accessibility.

The customer's location can be easily auto-located from their device by using the Google Maps GPS features. Customers can change the delivery location on the home page.

Seller-based product navigation and purchases:

Customers can view categories and products separated by seller/vendor. Navigation is improved with category and subcategory icons for a better UI classification.

Store Admin App-v2.0:

Tablet/iPad View has been added to the admin mobile app for better accessibility and usability for Store admins. Sellers can now easily mark products out of stock and manage prices from the app.

Seller-based Delivery Slots:

The store admin can set delivery slots specific to sellers. Each seller might have their own delivery slot availability which can be configured accordingly.

Customers buying from a seller can check out using the slots set up by that seller.

Simple Delivery Slots:

The store admin can configure delivery slots that are not dependent on postal codes, area, or seller. The store admin can simply add delivery slots based on the standard delivery availability of the admin.

Simple delivery slots avoid the need to configure separate area and seller-based slots, even if the platform is a multi-seller checkout system.

Delivery tracking for the customer

Customers can track delivery progress from the app and call the [delivery driver/ partner](#) from the app.

Elite mCommerce 3.4 New Features

Autofill address form:

Users can fill in addresses more quickly based on their street address using autocomplete without needing to input an area code, state, or country manually.

WhatsApp Notifications to Admin and Customers:

On order placement, customers can receive notifications on their WhatsApp. WhatsApp notifications are sent to customers on other events such as invoices, credit memos, and offers. Customers can chat with store staff through WhatsApp.

Product Offer Ribbon:

Store admins can add ribbons over product offers and display products with ribbons on the top to mark them as special offers. They can add any number of products and display the offer ribbon over the products to show all current offers. Customers can easily view products with offer labels.

Buy Now, Pay Later feature:

Customers can place an order using the Pay Later option. Stores are allowed to edit the order, change the product quantity based on availability, and remove or add any product from the order.

The customer will receive the updated details to confirm and make the online payment, or else send their feedback to the admin for further changes if any are required.

Best-Selling products on homepage:

Best-selling products can be identified based on past sales history. They can then be displayed on the home page to promote popular items to customers. Any number of best-selling products can be displayed on the home page as a marketing strategy.

Veg/ Non-Veg Label:

Products can be marked Veg/Non-veg from the backend. Customers can see if a product is vegetarian on the app and website if they prefer to purchase vegetarian products.

Product Positioning on sorting:

Products can be positioned as desired by the store admin. Store admins can assign position numbers to the products in the backend to set the display position of items.

New OTP based login method:

We introduced a new OTP verification code system for logins as an alternative to email-based logins, letting customers create an account quickly after installing the app.

User Experience Improvements:

Several tweaks have been made for a faster and more convenient user experience. Customers can now view all categories by clicking on the link on the home page. They can view categories

and subcategories. A new category page view lets them view categories without image icons. Customers can toggle between subcategories of the same categories and view product listings. This makes it easier to switch between subcategories for a faster user experience. Apps now offer faster navigation through the footer menu which allows navigation to Home, Categories, Account, and Settings. This helps customers easily navigate to the most important pages on the app. A new Search screen has been added to marketplace-based apps for a better UI experience. Customers can log out in one click thanks to a new logout button in the app menu.
