

Bay-Bay Water's Stomach-Friendly Purified Distilled Water is Phosphate Free

The company that makes it safer than ever before for parents to provide purified distilled water for babies has made an important announcement.

MIAMI LAKES, FLORIDA, UNITED STATES, September 21, 2021 /EINPresswire.com/ -- Representatives with [Bay-Bay Water](#) today announced that its [distilled water](#) is free from phosphate.

"We are very excited to make purified, phosphate free distilled water available for babies," said Osmay Gonzalez, spokesperson of the company.

"Phosphate in water encourages a process called eutrophication, which means the water develops less dissolved oxygen and increases in mineral and organic content," explained Osmay, "Phosphorus is important for good health, but too much phosphorus can cause diarrhea, hardening of organs and soft tissues, and interference with the body's ability to process other minerals like zinc or magnesium. To be the best distilled water for babies, Bay-Bay is 100 percent phosphate free and stomach friendly."

Osmay said the company's distilled water is certified by National Testing Laboratories Ltd. following the U.S. Food and Drug Administration Quality Standards 21CFR Section 165.110(b).

"Your baby's safety is our top priority; that is why we inspect each and every bottle and check our filters regularly," Osmay said. "This ensures that our water is always pure, fresh, and clean. The water is distilled and purified according to high standards to maintain reliability and customers trust."

Osmay explained that distilled water is the purest form of drinking water on the planet.

"The purifying process occurs by boiling water into vapor and condensing it back into a liquid form. It is recommended for parents to use distilled water when mixing baby formula and cereals, to avoid an unhealthy intake of minerals. Since life is constantly in motion, our distilled water is designed for easy, on the go use," Osmay said. "To ensure we provide you with the best distilled water for baby formula, our quality control checks are extremely thorough. Filter inspections and change-outs are on a strict schedule. Ozone levels are checked every hour. Daily and hourly records of ozone levels and filter changes are mandatory."

Osmay went on to explain that at its production facility, the single service bottles arrive wrapped in cling film. Before the pallets of bottles leave the truck, he said, they are visually inspected to ensure no cross-contamination of any kind has taken place during transport. The pallets are stored in a secure area. Before each bottle is filled, it enters an enclosed chamber to receive a sanitizing ozone rinse. The purified water used to fill the bottles passes through a UV filter. Bottles are capped in the filler station, not sent open to the next stage of production.

“For the best bottled water for babies on the go, we only use BPA-free and Phosphate-free #1 PETE (Polyethylene Terephthalate) bottles,” highlighted Osmay and went on to add, “our filtered and distilled water is subject to rigorous safety and quality control tests every step of the way, ensuring that you always get the safest, cleanest, purest bottled water for babies.”

Each bottle is 16.9 ounces, and the 24-bottle pack has a lower per bottle price than the 12-bottle pack.

As to why anyone should give Bay-Bay Water a try, Osmay said that its distilling process is carefully monitored and far above average.

“First the water is softened, then it passes through a 1-micron filter to screen out any microscopic impurities,” Osmay said. “Only filtered water enters the distiller, and following the distilling process, it is stored in temperature-controlled silos until it is ready for ozone treatment and packaging. Typically, water is purified by one of three processes: reverse osmosis, distillation, and de-ionization. Bay-Bay relies on the distillation process, which involved boiling, condensing, and steaming to provide the purest result.”
