Non-small cell Lung cancer is the malignant tissue formation in the lung, usually in the cell lining air passage, which is characterized by abnormal cell growth in lung tissue. Globally, lung cancer is one of the leading causes of death for the past several decades. According to the

American lung association, the number of deaths due to lung cancer has increased ~3.5% from ~152,156 cases in 1999 to ~157,499 in 2012. Furthermore, it is estimated that ~158,040

Americans are would die due to lung cancer by 2015. According to the American Society of cancer, non small-cell lung cancer accounts for ~85% to 90% of overall lung cancer cases, and the trend is expected to grow with the same momentum. Thus, a large patient base of non small-cell lung cancer depicts the unmet need for diagnosis and treatment. It has been observed that non small-cell lung cancer is the most prevalent type of lung cancer commonly caused due to active and passive smoking.

Covid-19 Scenario:

- 1) The Covid-19 pandemic and followed by lockdown has affected several manufacturing industries.
- 2) The prolonged lockdown resulted in a disrupted supply chain and increased the prices of raw materials.
- 3) However, as the world has been recovering from the pandemic, the market is estimated to get back on track.
