A breast biopsy is the procedure of locating a diseased tissue in the breast and collecting the specimen sample of the area for further examination and diagnosis. Breast biopsies are performed by using minimally invasive biopsy systems, owing to minimal disfigurement and pain. Non-invasive biopsy techniques provide preventive measures that assist physicians in diagnosing and treating high-risk breast cancer. This information prevents the application of chemotherapy in breast cancer, reducing the complexities of chemo-radiations. Vacuum assisted breast biopsy devices (VAB), core needle biopsies and fine needle aspiration biopsy are commonly used to perform biopsy procedures.
