Antibiotics serve a useful therapeutic purpose for the
treatment and control of pathogens. The medications are
used to either inhibit or prevent bacterial infections
referred as bactericidal and bacteriostatic antibiotics,
respectively. Various types of antibiotics such as penicillin,
cephalosporin, carbapenem, and monobactam are
available in pharmacies and hospitals that are used to
treat infectious diseases. However, antibiotic resistance is a

global problem and it is considered a threat, owing to its effect on morbidity and mortality. The
treatment with the help of oral antibiotics has the potential to reduce prolonged hospital stay,

treatment cost, and further complications. Oral drug delivery continues to rise in popularity as key players are focused on extending R&D efforts, thereby improving patient convenience.
