Breast cancer is a type of cancer that starts in the breast when cells begin to multiply uncontrollably. Breast cancer cells usually form a tumor that is visible on an x-ray or can be felt as a lump. Breast reconstruction is a surgical operation that restores shape of breast after mastectomy (surgery that removes breast to treat or prevent breast cancer) or any procedure used to correct congenital

deformities.

As per the American Society of Plastic Surgeons in 2018, breast reconstruction is considered as one of the top five preferred cosmetic surgical procedures in U.S. Thus, the high number of these surgical procedures have resulted in increased demand for products associated with them, such as implants and tissue expanders expanding their market as well. As per the data published in 2016, by American Cancer Society, 61.0% of women with stage I or stage II breast cancer undergo lumpectomy or breast-conserving surgery, and around 36.0% of them choose for mastectomy.

COVID – 19 scenario analysis:

Due to the COVID – 19 outbreak, majority of healthcare, pharmaceutical and biotechnology organizations have concentrated on diagnostics kits, safety wearables (PPE kits, face shields, masks) and treatment therapies and medication against Novel coronavirus

R&D labs are also focusing on finding a breakthrough vaccine against Novel coronavirus

In addition, the medical professionals are engaged in providing COVID-19 related services, as a result, other healthcare segments have to face negligence

Similar has been the story for Breast cancer patients in U.S. where diagnosis and treatment of 325 thousand cases were projected in year 2020
