Conventionally, the treatment pattern for non-small cell lung cancer is focussed around chemotherapy. Surgery is not suitable for most of the people diagnosed with lung cancer, thus, chemotherapy remains the cornerstone for non-small cell lung cancer treatment. However, emergence of targeted therapies for patients has widened the scope of NSCLC treatment by providing lesser side effects and effective treatments as compared to chemotherapy. The launch of new drugs in several new drugs classes would address the potential unmet need among NSCLC patients over the forecast period. The potential drivers for lung cancer therapeutic market include active & passive tobacco

smoking, geriatric population and improper lifestyle.
