Osteoporosis is a medical condition which involves the weakening of the bones. This medical condition is caused due to the overexpression of the parathyroid hormone. Moreover, the weak bones are porous and susceptible to serious fractures. Therefore, osteoporosis has a significant impact on quality of life of patients such as the condition leads to limited mobility. Thus, this medical condition

requires treatment which includes the administration of drugs such as bisphosphonates

selective estrogen inhibitors modulator (SERM), parathyroid hormone therapy, calcitonin, rank ligand inhibitors and others. Furthermore, these drugs are administered through different routes in the body. For instance, some osteoporosis drugs are administered through the oral route whereas others are administered through the intravenous route.

- 1) The Covid-19 pandemic and followed by lockdown has affected several manufacturing industries.
- 2) The prolonged lockdown resulted in a disrupted supply chain and increased the prices of raw materials.
- 3) However, as the world has been recovering from the pandemic, the market is estimated to get back on track.

By drug class, the bisphosphonates segment acquired the major share of osteoporosis drugs market in 2018 owing to increase in investment in R&D of advanced novel bisphosphonates drugs by major players. However, rank ligand inhibitors segment is expected to exhibit fastest growth rate during the forecast period owing to the fact that these drugs are used treat bone metastasis by acting as a chemoattractant to bone for tumor cells that express its receptor, RANK. Thus, the inhibition of the RANKL-RANK pathway acts as an ideal treatment for bone metastasis which makes them a preferred choice of drug.
