Hypertension is a long-term medical condition, which is marked by a rise in blood pressure.

Blood pressure is considered higher than normal when the systolic blood pressure is more than 140mm Hg or the diastolic blood pressure is more than 90 mm Hg. Moreover, this medical condition is accompanied with other complications such as dementia, heart failure, and kidney diseases. Therefore, this condition requires an early diagnosis and treatment. The drugs employed in the treatment of this condition are termed as antihypertensive. Different types of antihypertensive drugs available in the market include calcium channel blockers and vasodilators.
