The function of the kidney is to remove waste products and excess fluid from the blood. This process is carried out with the help of dialysis when the kidney is not functioning properly. Waste products, such as urea and creatinine, are removed from the blood with the help of artificial and natural semipermeable membranes. In hemodialysis, the blood is purified using an artificial membrane, whereas, in peritoneal dialysis, the waste products are removed using peritoneum in abdomen, which acts as a natural semi-permeable membrane.
