The report provides a detailed analysis of changing market dynamics, top segments, value chain, key investment pockets, regional scenario, and competitive landscape.

A vaccine is a substance that is introduced into the body to prevent infection or to control disease due to a certain pathogen, which is a disease-causing organism, such as a virus, bacteria, or parasite. The vaccine teaches the body how to defend itself against the pathogen by creating an immune response. Preventive vaccines work to protect an individual from infection or disease by introducing a small component or a non-harmful form of the pathogen (called the foreign antigen) into the body. The body produces an

immune response to the pathogen by generating antibodies (via the humoral response), killer

cells (via the cell-mediated response), or both.
