

Versasec Releases Latest Version of vSEC:CMS S-Series

Version 6.2 of the award-winning software focused on cybersecurity enabled by hardware PKI includes support for Sectigo Certificate Manager

STOCKHOLM, SWEDEN, November 30, 2021 /EINPresswire.com/ -- Versasec, the leader in identity and access management (IAM) software, today announced vSEC:CMS 6.2. The upgraded credential management system (CMS) software offers support for Sectigo Certificate Manager (SCM), an integration that broadens the options for customers who are looking for cloud-managed public key infrastructure (mPKI).

With its flagship product, vSEC:CMS, Versasec makes business more secure. vSEC:CMS helps companies of all sizes easily deploy and manage virtual and physical smart cards, tokens, Windows Hello for Business and other public key infrastructure (PKI) based credentials from the day an employee joins until that employee leaves the company.

The newest version of our user-friendly CMS software also provides improvements in how administrators assign the system operator roles. vSEC:CMS offers highly granular and customizable roles, by mapping Active Directory groups to these roles, customers can now add, change and remove roles assigned to their operators directly from Microsoft Active Directory. The new feature allows for this with a simple change of the group membership of the operators. While this feature was initially driven by the needs of customers migrating from other CMS, Versasec recognizes this is a powerful feature for our existing customers as it enables integration

Versasec Releases Latest Version of vSEC:CMS S-Series

Versasec - Managing Digital Identities

of vSEC:CMS role assignments from outside of vSEC:CMS in an automated, controlled manner.

vSEC:CMS 6.2 offers important new administration features, including a repository where the system collects and stores all vSEC:CMS client version information. Operators can now quickly and easily see which version of the software is installed on every client connected to vSEC:CMS.

"vSEC:CMS 6.2 brings a new level of sophistication and ease to our enterprise users, with a variety of system management enhancements that make administering the software easier than ever," said Joakim Thorén, CEO of Versasec. "We listen to our customers, and they will see many of their requested features and attributes are built into this new version."

The new version also incorporates a variety of enhancements, updates and automated tasks, including the following:

- Added support for user encryption keys to be generated in Thales SafeNet Luna, Utimaco and Securosys Primus HSMs
- Major API developments: SOAP API can now query the vSEC:CMS database and the COM-API is even more powerful
- Added support for preconfigured key containers on Thales IDPrime MD 940
- A new scheduled task has been added to auto update the vSEC:CMS database with user credentials data via the user application
- Added additional diagnostics and performance measurements
- Enhanced support for Feitan and CryptoVision credentials
- vSEC:CMS User application on MacOS now supports Versasec's PIN policies if added to credentials during issuance
