“

As a result of the ongoing COVID-19 pandemic crisis, the overall performance of the cookware industry has dropped, And Pay reduction has been implemented for the factory workers.”

*Shankar Bhandalkar*

Non-stick cookware is a utensil whose surface is engineered in such a way that the risk of food items to stick on the cookware minimizes. A coating of a smooth texture (non-stick coating) on non-stick cookware prevents the food from sticking to the utensil or from getting burned or overcooked. A variety of non-stick cookware is present in the global market, coated by using different raw materials like Teflon, aluminum, enameled iron, ceramic, and many others.

An increasing number of nuclear families and a rising number of individual migrants to urban cities or in any other corner of the world has led to an increased demand for the cookware for their kitchens. Along with this, rising income, increasing disposable income, rising spending capacity, preference for advanced cookware, supports the global market growth for the non-stick cookware market.

Additionally, males, females, and even children these days are inclining towards trying new dishes, driving the growth of the non-stick cookware market. Also a shifting preference towards easy-to-clean nonstick products, rising number of fast-food giants, the ability of non-stick cookware to withstand very high temperature, and rising popularity of the ceramic coated non-stick cookware are few other factors that surge the global market growth for the non-stick cookware.

However, increasing investment in research & development, developing and launching a new product, and aggressive marketing strategies create revenue opportunities for the players operating in the non-stick cookware market. For instance, ScanPan Inc., a US-based cookware manufacturing company, in 2001, launched a ceramic-based titanium nonstick cookware, which is easy to use and wash and does not contain any harmful metals or chemicals.
