On the basis of geography, the global dial thermometer market is segmented into North America, Europe, Asia Pacific, Latin America, Middle East, and Africa. North America held the dominant position in the market in 2016 and is projected to retain its dominance throughout the forecast period. Increasing consumption of oil in this particular region is one of the factor that has led to high number of plants for oil manufacturing. For

instance, according to the U.S. Energy Information Association's (EIA) analysis, the U.S. total consumption of oil in 2015 was 767 metric tons, which had grown to 771 metric tons in 2016. Therefore, as a number of manufacturing plants of oil and refineries increases, it will proportionally increase demand for dial thermometers.

A thermometer is a device that measures and displays the temperature of a specific application or condition. A Dial Thermometer can be read at the point of measurement or from a distance using the appropriate length of capillary tubing. For over 200 years, bi-metal technology has been used in thermometers. It is currently used in thermostats, wall thermometers, grills, circuit breakers for electrical heating devices, and other household applications.

The benefits of these thermometers include their low cost, ease of reading, ability to be submerged in liquids, low maintenance requirements, and dependability. The disadvantages are that they are easily broken, and if the glass tube breaks, there is a risk of mercury poisoning. A bimetal spring serves as the temperature sensing element in a bimetal thermometer. A coil spring made of two different metals that are welded or fastened together is used in this technology. Copper, steel, or brass could be used as long as one has low heat sensitivity and the other has high heat sensitivity. When the welded strip is heated, the two metals change length due to their different rates of thermal expansion.
