Dendritic cells (DCs) refer to rare kind of leukocytes. They have prompted their recent application to therapeutic cancer vaccinations as they are uniquely effective in their ability to present antigens to T cells. Isolated DCs loaded with tumor antigen ex vivo and administered as a cellular vaccine are found to induce protective and therapeutic anti-tumor immunity in experimental animals. Increase in prevalence of cancer, improvement of technology such as drug innovations regarding cancer, upsurge in awareness about cancer and their available therapies in the market, and increase in health care expenditure drive the market. In contrast, low accessibility to vaccines in remote areas and stringent regulatory procedures restrain the market.
