The electronic printed circuit board (PCB) market has grown rapidly in recent years, owing to the ongoing development of consumer electronics devices and rising demand for PCBs in all electronics and electrical equipment. Printed circuit board (PCB) is an electronic circuit that is utilized in devices to offer mechanical support as well as a path to the electronic components. It is produced by fusing together various sheets of non-conductive material, such as fiberglass or plastic that can easily contain copper circuitry. PCBs were invented in the early twentieth century, but technology has continued to advance since then. The advancement and general implementation of PCB technology has matched the rapid advancement and widespread adoption of semiconductor packaging technology, allowing industry experts to invest in smaller and more efficient electronics devices. However, inconsistent PCB surface finish and the difficulty of repairing once damaged, limits the growth of the electronic printed circuit board (PCB) market.
