After inguinal hernia, undescended testis is the second most common pediatric condition in about 5% of the boys at birth or within the first 3 months. It happens due to the failure of the normal descent that the testis is not in the scrotum. Studies have found out that quite a few baby boys are born with cryptorchidism where either one or both the testicles are not located properly in the scrotal position. If tended to at the appropriate time, it might reduce the risk of malignancy or infertility.
