3D log scanning is being integrated with saw mill manufacturing equipment to produce high-grade lumber at mills. A 3D log scanner is a scanner that measures the actual shape of the logs by coupling vision sensors with geometric data on the log. This helps to increase resolution quality, scan speeds, and laser lighting which is used to measure dark logs leading to a high-grade lumber recovery. This technology is widely used in super mills which are a conglomerate of satellite mills with around two three log lines. Also, sensors used in 3D log scanning help to

capture the knots faster leading to an optimized yield.
