The sonar systems market consists of sales of sonar systems by entities (organizations, sole traders, and partnerships) that refer to the systems based on the SONAR (Sound Navigation and Ranging) technology. Sonar is a technique in which sound waves are propagated at a certain frequency for mapping distance and objects especially in marine navigation since sound waves can travel a longer distance in the water than radar and light waves. Sound waves emitted or reflected by an object are detected by sonar apparatus and analyze information to develop nautical charts, locate underwater hazards, map objects on the seafloor such as shipwrecks, and map the seafloor itself.
