The grain products market consists of sales of grain products by entities (organizations, sole traders, and partnerships) that mill flour meal from grains or vegetables, prepare flour mixes or doughs from flour, mill, clean and polish rice, and produce malt from barley, rice, and other grains. The companies in the grain products industry process raw materials into grain products, package and distribute them through various distribution channels to both individual customers and commercial establishments.

Flour milling companies are using NIR analyzers to improve production efficiency. Near-Infrared (NIR) analyzer is an analytical instrument used to determine moisture, protein, fat, and other parameters in a food sample. NIR analyzers used in flour mills analyze wheat and flour for moisture, protein, and ash content. NIR analyzers monitor the grain in all the steps of a milling process and give real-time access to quality control parameters. This helps in minimizing manufacturing errors, downtimes, and rejections, thus improving flour quality and consistency.
