Respiratory heaters are external type heating devices used along a nebulizer system. Nebuliser is a medical device

(drug delivery device) that helps an individual to breathe in medicine as a fine mist through a mask or a mouthpiece. This allows the drug to enter directly into the lungs. Respiratory heaters deliver heated aerosols and breathing gas to those who require respiratory support through a tracheal tube or nasal cannula. Moreover, respiratory heaters have the ability to combine warm

ambient air and oxygen for users.

They are often used by people who require the high flow therapy. High flow oxygen therapy is a breathing support. It is used to provide a high flow of medical gas through a tube placed in the nostrils. The respiratory heater warms the solution and heats the dilute air. Thus, respiratory heaters also used to treat chronic obstructive pulmonary disease (COPD), asthma, & bronchitis.
