The global buccal cavity devices market was valued at \$2.0 billion in 2020, and is projected to reach \$4.5 billion by 2030, registering a CAGR of 8.40% from 2021 to 2030. Buccal cavity devices are used to capture radiographic images that can be viewed on a monitor or tablet. The obtainment of the radiographic images is accomplished through x-ray exposure and is referred to as direct digital imaging. These devices are used to simplify the process of obtaining high-quality dental images for patients and relaying the visual information to them in a quick and efficient manner. However, digital sensors offer clinicians far more when it comes to the way radiographic images can be used. With better resolution, dramatically reduced radiation to the patient, and software the gives clinicians the ability to zoom into parts of the image and to apply filters for enhanced diagnostics, digital dental intraoral flat panel sensors are friendlier to the

patient and doctor.
