Key Trends In The Facial Tissues Market

Companies in the facial tissue market are increasingly using TAD (Through Air Drying) technology to manufacture facial tissues to have cost benefits. In TAD process, the fibre web is dewatered and dried by non-compressive means, thereby avoiding the compaction that occurs during wetpressing of the web in the conventional process. The use of these non-compressive waterremoval technologies results in a product with improved properties such as high bulk, softness, cross direction (CD) stretches and absorbency. Fibre savings are possible for TAD tissue as the weight of the sheet can be reduced due to the higher bulk. Since fibre is usually the highest cost element in a tissue product, reduced fibre cost is the major advantage associated with the use of TAD technology. Leading players in the facial tissue paper market are now focusing on improving their production processes by adopting product extension techniques, novel marketing strategies and also making strong investments in R&D into already established factories by adding innovation to these facilities and boosting sales. The facial tissues market consists of the sales of the tissue papers or wipes or paper handkerchiefs that are thin, soft, absorbent, smooth and disposable which are used for cleaning face and reducing the spread of an infection or diseases as like swine flu. The market includes the sales of various types of facial tissue papers such as regular facial tissue papers, anti-viral facial tissue papers, and recyclable facial tissue papers. The facial tissues that have been used at home and away from home (restaurants, hospitals and healthcare industry) are included in this market.
