Market Overview

Genitalwartsare one of the most recurrent types of sexually transmitted infections. The human papillomavirus is the virus responsible for causing genital warts. People will get infected with at least one type ofhuman papillomavirus(HPV) at some point during their lives. Genital warts affect most of the moist tissues in the genital areas of male and female patients. Although the genital infection is asymptomatic, it's frequently recognized as genital warts due to the onset of symptoms. It is estimated that around 1% of sexually active men and women in the United States have genital warts.

Genital warts are caused due to the human papillomavirus (HPV). There are around 30-40 strains of HPV. However, only a few of the strains cause genital warts. The virus is easily transmittable through skin-to-skin contact. Hence it's considered a sexually transmitted infection (STI). The Center for Disease Control and Prevention (CDC) says that people get genital warts due to the mutant activity of HPV.
