Key Trends In The Minimal Invasive Surgery Devices Market

Technologically advanced minimally invasive surgery (MIS) devices with improvements in image guidance, fiber-optics, mini dental implants, and robotic control systems are increasingly opted by patients to treat medical conditions such as aneurysms, cardiac procedures, dental and spinal procedures. Less-invasive surgical procedures with enhanced capabilities in the areas of imaging, micromachining, robotic equipment and components, software systems, and others are becoming popular in the healthcare industry. For instance, video-assisted thoracoscopic surgery (VATS), is a minimally invasive surgical procedure performed to completely remove an organ of the human body to treat traumatic injury, infection, or cancer in the lungs. VATS is performed using a video camera where a small tube called a thoracoscope to which the camera is connected, is inserted through a small incision between the ribs. Furthermore, imaging technology involved in MIS, virtual reality (VR) is becoming a significant area of development. Other MIS techniques are applied to perform surgeries such as single-site laparoscopic surgery, robotic surgeries, needlescopic surgery, cardiac and spinal surgeries, and others.
