Slab Repair services in Fort Worth expand

What causes foundation and slab failure in Fort Worth Texas?

Foundation Repair in Texas typically is caused by water, too much water can cause foundation failure, or not enough water can cause slab failure. In Texas, the soil gets hot and then dry, the soil tends to shrink and then can develop cracks that do not adequately support the weight of the structure like homes, so then the homeowner experiences settlement. Droughts cause soil to shrink and decouple from the foundations and slabs of houses. This also can lead to the generation of cavities and gaps between the ground and the foundations. This removes the natural support between the ground and the foundation of the house which can lead to cracks and failure of the slab. Cracks will begin to form and increase as gravity continues to push the weight of your home down onto the pockets or gaps that are created but the shrink and erosion of soil.

What Texas Counties are affected by the drought of 2022?

Texas has seen a significant state-wide increase in Foundation and Slab Repair requests due to the 2021-2022 Drought in Texas. According to
