comfortable home.

What causes foundation and slab failure in Dallas Texas?

Foundation cracks and slab cracks in Texas are typically caused by water, either too much water can cause foundation failure, or it can be not enough water that can cause slab failure. In Texas, the soil gets heated and then the soil dries out, the soil then tends to shrink which then can causes cracks which do not adequately support the foundations or slabs the weight of the structure like homes, This can lead to the homeowner experiencing settlement. Droughts usually cause soil to shrink and decouple from the foundations and slabs of Texas houses. This usually leads to the creation of pockets and gaps between the ground and the foundations of structures. This process of expanding and contracting soils removes the ground support between the slab and the foundation of the house which can lead to cracks and failure of the slab. The slab cracks will begin to form and increase in size as pressure from gravity continues to push downward putting the weight of the home down onto the pockets or gaps that are created but the shrinking and erosion of soil.

What Texas Counties are affected by the drought of 2022?

Texas has seen a significant state-wide increase in Foundation and Slab Repair requests due to the 2021-2022 Drought in Texas.
