Market Application:

Liposomal doxorubicin refers to a chemotherapy drug utilized for the treatment of numerous autoimmune disorders as well as the liver, breast, endometrial, gastric, and kidney cancer. It functions by stopping or reducing cancer cell growth in the body. The medication is folded in a fatty covering of pegylated liposome and is administered intravenously by an injection. In addition to this, the doxorubicin drug blocks the enzymes required through cancer cells to separate and grow and the liposomes make sure that the drug stays in the bloodstream longer and reaches the cancer cells for improved efficacy. The dosage of the medication depends on the patient weight, height, general health, etc. As compared to the traditionally used drugs, liposome doxorubicin exhibits lesser toxicity, myelosuppression, alopecia, nausea, etc.
