Sclerotherapy is a procedure that has been used for decades to treat a variety of vascular conditions, such as varicose veins or spider veins. During the procedure, a sclerosant liquid is injected into the affected veins and works by irritating them, causing the walls of the veins to collapse. This causes blood flow to be redirected away from the affected vein and back through deeper, healthier veins. The main benefit of sclerotherapy is that it can improve circulation and reduce visible signs of vascular conditions like varicose and spider veins. The procedure can also help reduce pain or discomfort associated with these conditions. It's important to note that while it's designed to improve appearance, sclerotherapy may not totally eliminate all visible signs of vein disease, though multiple treatments may be necessary for optimal results.
