Diesel Rotary UPS (DRUPS) is a powerful solution that stands out from the traditional Uninterruptible Power Supply (UPS). This technology combines both diesel generators and rotary UPS systems, providing an efficient way to ensure continuous power supply. It offers many advantages over traditional UPS systems, including greater reliability and scalability.

DRUPS consists of a large diesel generator that is connected to a flywheel/rotating mass storage device. During normal system operation, the generator provides all the necessary electrical power to meet the load requirement while simultaneously charging up the flywheel energy

storage device. When an outage occurs, electricity from the flywheel is used to bridge any gap until utility power returns or until it runs out of stored energy. This helps prevent any data loss or disruption caused by an unexpected outage.
