Centrifugal pumps and positive displacement pumps are both types of fluid transfer systems used for a broad range of applications. Centrifugal pumps rely on kinetic energy to move fluids

from one place to another, while positive displacement pumps rely on pressure differences between two areas. Both technologies come with their own set of advantages and disadvantages, making them suitable for different scenarios.

A centrifugal pump works by using an impeller to create a vacuum that sucks the liquid into the system. The rotating impeller then accelerates the liquid outward and pushes it through the discharge nozzle at high velocity. This type of pump is typically used to transfer liquids or slurries with low viscosity over short distances due to its relatively low cost, lightweight and efficient operation compared with other pump types.
