LASIK surgery is an effective method of correcting vision and is used in the treatment of vision-correcting surgery that uses guided lasers to reshape the cornea of the eye, which then correctly refracts light back onto the retina, creating a clearer image of the world. LASIK, which was approved by the FDA in 1998, is one of the most popular types of outpatient surgeries for refractive errors such as nearsightedness, farsightedness, and astigmatism. These errors are caused by irregularities in the shape of the cornea, which is a lens that refracts light onto the retina so that it can be transmitted up the optic nerve and processed into an image by the brain.
