The report covers a comprehensive impact analysis of the global health crisis on the overall growth of the market. The most recent research report is an excellent illustration of the thorough examination of the global Enteral Feeding Devices market.

One of the primary restraint for market revenue growth is complications associated with enteral feeding devices. Possible complications include peristomal infection, leakage, inadvertent tube removal, tube obstruction, tube fracture, tube displacement, peritonitis, aspiration pneumonia, hemorrhage, gastric mucosa overgrowth, and mortality. Electrolytes, vitamins, trace elements, and water deficit or excess are examples of metabolic disorders. Patients receiving artificial assistance should be observed regularly as a consequence, especially considering the danger of developing refeeding syndrome. The global enteral feeding devices market size is expected to reach USD 6.30 Billion at a steady revenue CAGR of 6.6% in 2030, according to latest analysis by Emergen Research. Increasing prevalence of preterm births is a major factor driving market revenue growth. For instance, every year, over one million children die as a result of premature birth complications. Many survivors would be crippled for rest of their lives, suffering from learning disabilities as well as eyesight and hearing problems. In such preterm infants, it is essential to provide early adequate enteral feeding since there is an increased risk of gut atrophy, infections and cholestasis, as well as greater hospitalization and expenditures associated with extended parenteral nutrition. Thus, increasing prevalence of preterm births is leading to rising demand for enteral feeding devices.
