### Procurement Resource Assessment of Natural Gas Production Process:

1. [Natural Gas Production From Extraction Using the Natural Gas Wells](#): This process provides a detailed economics of the natural gas production/extraction from the natural gas wells. During the process, the initial step is perforating, and drilling of the well that extends about a mile into the surface of the earth and the gas is trapped inside steel cases and pipes. Next, the fracking fluid creates new fractures in the nearby rocks, which enables the floating of the natural gas. From the surface, this floating gas gets transferred after being collected and processed. At last, it gets transported to nearby tanks and stored.

### Product Definition:

Natural Gas is a fossil fuel that appears to be a colourless gaseous mix comprising hydrocarbons and gases such as nitrogen, methane, and carbon dioxide. It is used as an energy source that is formed over millions of years when the remains of plants and animals go through pressure and heat under the thick layers on the surface of the earth, turning it into natural gas. It is a highly flammable gas with few impurities, lower chemical complexity, and produces less carbon dioxide after combustion.

## Market Drivers:

The demand for natural gas is being fuelled by its extensive use in electricity generation and other household applications of heating and cooking, which is accelerating its market growth. Furthermore, it finds application as a fuel for many vehicles, which drives its market demand further. Additionally, it is used in the production of fertilizers, plastics, as well as dyes as a chemical feedstock that furthers the industrial demand for the commodity. Also, due to its properties of being inexpensive and reliable, it is widely popular, making it an ideal choice for consumers. Besides these main applications, it is also used to make fertilizer for ethanol to make methane for hydrogen and the production of many everyday products that further its market's expansion.
