Based on where the fluid builds up in our bodies, there are two different types of pulmonary edoema. When a cardiac condition, such as heart failure, is the root cause, pulmonary edoema known as cardiogenic edoema develops. Edema in the lungs is typically a symptom of heart failure. Acute respiratory distress syndrome (ARDS) or high-altitude pulmonary edoema are examples of non-heart diseases that can lead to non-cardiogenic pulmonary edoema (HAPE).
