Localized scleroderma is a type of skin fibrosis that typically affects only the skin and underlying tissues, whereas systemic sclerosis (SSc) is a more severe form of the disease that can affect multiple organs and systems, including the skin, lungs, kidneys, and heart. Chronic graft-versus-host disease is a complication that can occur after a stem cell transplant, where the transplanted cells attack the patient's body, leading to tissue damage and fibrosis.

The underlying causes of skin fibrosis are not fully understood, but chronic inflammation is believed to play a key role in the development of the condition. In addition, exposure to certain chemicals or repeated trauma to the skin may also contribute to the development of skin fibrosis.
