Cancer therapeutics refer to the various treatments and approaches used to treat cancer, including chemotherapy, radiation therapy, immunotherapy, targeted therapy, and hormonal therapy. The goal of cancer therapeutics is to kill cancer cells, shrink tumors, and prevent cancer from spreading to other parts of the body.

Chemotherapy involves the use of drugs that target rapidly dividing cells, including cancer cells. Radiation therapy uses high-energy radiation to kill cancer cells. Immunotherapy works by stimulating the body's immune system to recognize and attack cancer cells. Targeted therapy involves drugs that specifically target cancer cells and their molecular pathways, while hormonal therapy is used to block hormones that promote the growth of certain types of cancer. Cancer therapeutics may be used alone or in combination with other treatments, depending on the type and stage of cancer, as well as the patient's overall health and medical history.
