EEG stands for electroencephalogram, and EEG equipment refers to devices that are used to measure the electrical activity of the brain. EEG equipment typically consists of a cap or a set of electrodes that are placed on the scalp of the person being tested, as well as an amplifier and a computer to record and analyze the EEG signals.

The electrodes in EEG equipment detect the electrical signals produced by the neurons in the brain and transmit them to the amplifier, which amplifies and filters the signals to remove unwanted noise. The amplified signals are then sent to a computer, which displays the EEG data as a series of waves or patterns.
