

Supreme Rejuvenation Raises Awareness on the Dangers of Using Cosmetics in Regenerative Medicine

Supreme Rejuvenation, a leader in exosome technology, is raising awareness on the dangers of using cosmetics in regenerative medicine.

HOUSTON, TEXAS, UNITED STATES, March 24, 2023 /EINPresswire.com/ --

Supreme Rejuvenation, a leader in exosome technology, is raising awareness on the dangers of using cosmetics in regenerative medicine.

The company emphasizes the importance of proper labeling and compliance, and warns against the use of cosmetics in treatments that require biological drugs.

It is illegal to use cosmetics internally in infusions, subcutaneous, and even in aesthetics.

“

Compliance and patient safety are top priorities at Supreme Rejuvenation. We care deeply about our clients and patients, and it's at the heart of everything we do.”

John Gwyn

Unfortunately, the majority of exosome companies are misleading their clients into believing that these treatments are safe and effective, despite the risks they pose to patients. Mixing a product in open air is unsanitary and using it internally on a patient is dangerous.

Supreme Rejuvenation is committed to providing safe and effective treatments to its clients. Its sterile saline [exosomes](#) are labeled as biological drugs, which ensures compliance with federal regulators. The company urges physicians, clinics, and hospitals to prioritize patient safety

by following proper labeling and compliance guidelines.

"Patients deserve safe and effective treatments, and it is our responsibility as providers to ensure that we are using the right products for the right procedures," said a spokesperson for Supreme Rejuvenation. "Using cosmetics in regenerative medicine is not only illegal, but it also

puts patients at risk. We urge all providers to prioritize patient safety and use only products that are properly labeled and compliant with federal regulations."

Supreme Rejuvenation is committed to educating physicians, clinics, and hospitals on the importance of compliance and patient safety. The company believes that by raising awareness on the dangers of using cosmetics in regenerative medicine, it can help improve the quality of care provided to patients.

For more information on Supreme Rejuvenation and its commitment to compliance and patient safety, please visit the company's website or contact us directly.

HOW THEY WORK

Stem cell-derived exosomes have been shown to be the source of healing in stem cell treatments. The process by which stem cell products heal the body is as follows: An injured tissue releases chemical markers signaling their damage > a stem cell absorbs these markers and creates the appropriate components for healing the tissue > the stem cell packages these components into a vesicle called an exosome > the exosome goes to the site of injured tissue and attaches > the exosome releases its contents to the injured tissue, healing the tissue. Stem Cell-derived exosomes have been shown to be efficacious in a number of studies related to the repair of peripheral nerve damage, traumatic brain injury, accelerated wound healing and bone fusion, tissue repair, anti-inflammatory effects, skin regeneration, cartilage regeneration, treatment for injured ligaments/tendons, osteoarthritis, bone regeneration, and vaginal rejuvenation.

Despite these reported effects of exosomes, there are currently no FDA-approved exosome products available in the US. **How They Work?**

- (1) An injured tissue releases chemical markers signaling their damage
- (2) A stem cell absorbs these markers and creates the appropriate components for healing the tissue
- (3) The stem cell packages these components into a vesicle called an exosome
- (4) The exosome goes to the site of injured tissue and attaches
- (5) The exosome releases its contents to the injured tissue, healing the tissue

How Do Exosomes Work?
