Dental CAD/CAM (Computer-Aided Design/Computer-Aided Manufacturing) materials and systems refer to technologies used in dentistry for designing and fabricating dental restorations, such as crowns, bridges, veneers, inlays, and onlays.

CAD/CAM systems consist of three basic components: the input device (scanner), the design software, and the output device (milling machine or 3D printer). The scanner captures the digital impression of the patient's teeth and gums, and the design software is used to create a virtual 3D model of the restoration. The output device then fabricates the restoration from a block of

material, such as ceramics or composites.

The materials used in dental CAD/CAM systems are specially formulated to be durable, esthetically pleasing, and biocompatible with the patient's oral tissues. Common materials include ceramics, such as lithium disilicate and zirconia, and composite resins.
